

PowerProfile®

FOR HOUSES AND LOW RISE MULTI RESIDENTIAL EXTERNAL WALLS

Hebel's PowerProfile is a simple way to accessorise your Hebel facade to replicate the look of traditional standing seam.

The PowerProfile system consists of Hebel's PowerPanel^{XL} 75mm thick, steel-reinforced AAC panels vertically secured to the structural frame via horizontal perforated top hat sections. When the facade is coated, decorative profiles are fixed to the substrate to achieve the desired look.

The powder coated, aluminium profiles are available in two forms and three popular Colorbond® colours: Basalt®, Dune® and Monument®.

Features and benefits:

- + An affordable option compared to that of standing seam and similar metal cladding systems.
- + Strong 75mm thick, steel reinforced panels provide a solid wall with deep window reveals.
- + Helps overcome the issues associated with morning and afternoon glancing light.
- + Choice of aluminium profiles and colours.
- + Maintains strong Hebel thermal and outstanding fire performance.
- + Suitable for timber and steel construction.

Fire rating: Up to 180/180/180 when subjected to an external fire source*.

Acoustic: Rw + Ctr 38 to 42 based on a 210mm wall system thickness.

Thermal: R2.13 to R3.29.

Common Wall Thickness: 199mm, based on 90mm stud + 10mm plasterboard + 24mm top hat + 75mm PowerProfile. With variations in stud thickness and top hats, wall widths can vary between 179mm to 210mm (excluding profile depth).

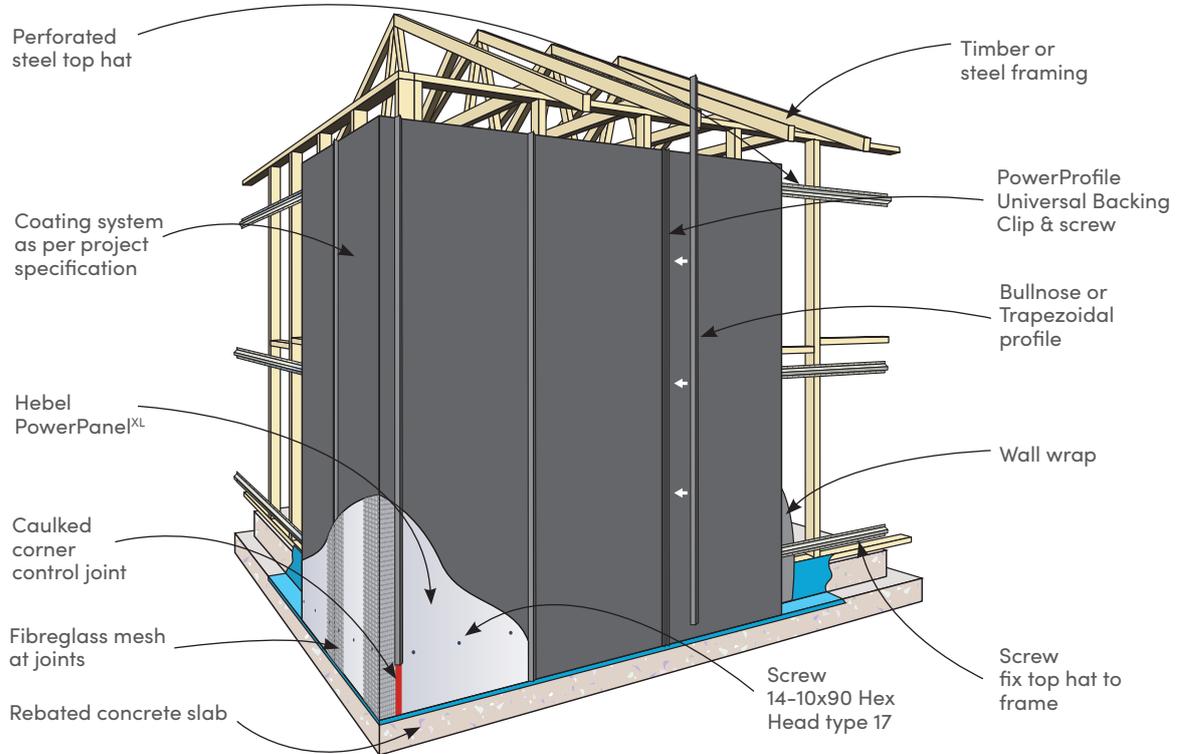

Standard PowerPanel^{XL} sizes:

- + 2400 x 600 x 75mm
- + 2700 x 600 x 75mm
- + 2850 x 600 x 75mm
- + 3000 x 600 x 75mm
- + 3300 x 600 x 75mm

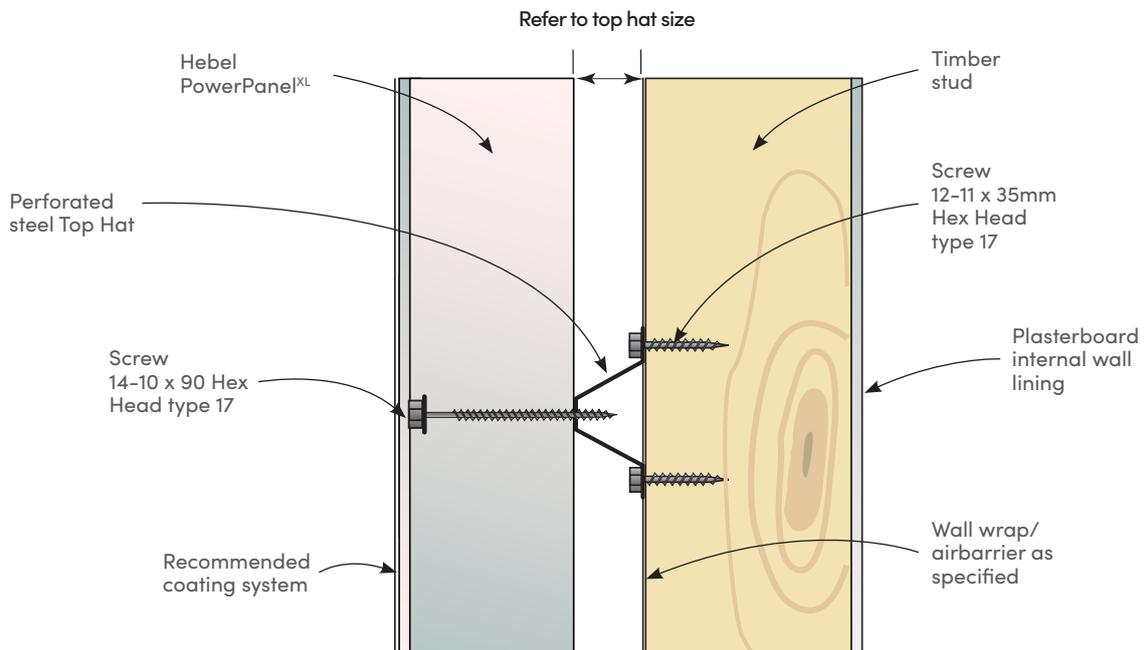

Coating system: Panels should be coated with a suitable and compatible acrylic coating system.

* Based on a system using Hebel Adhesive at panel joints.

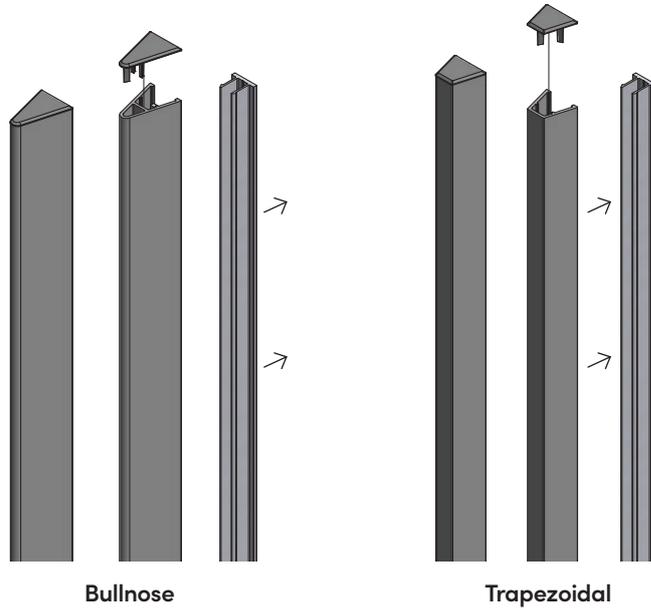

PowerProfile System

Hebel PowerPanel^{XL} Fixing to Top Hat

Profiles:

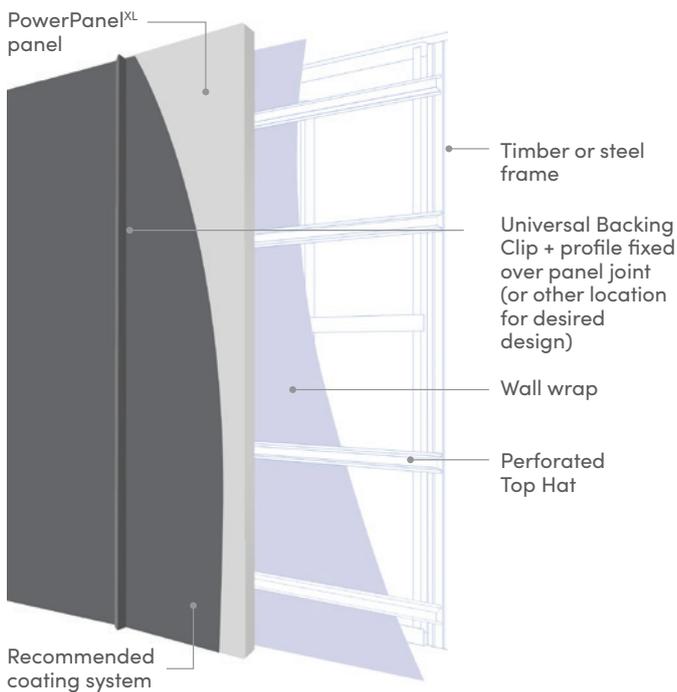

The Universal Backing Clip is fixed to the Hebel facade, and a powder-coated aluminium profile snaps onto the clip offering a myriad of design options.

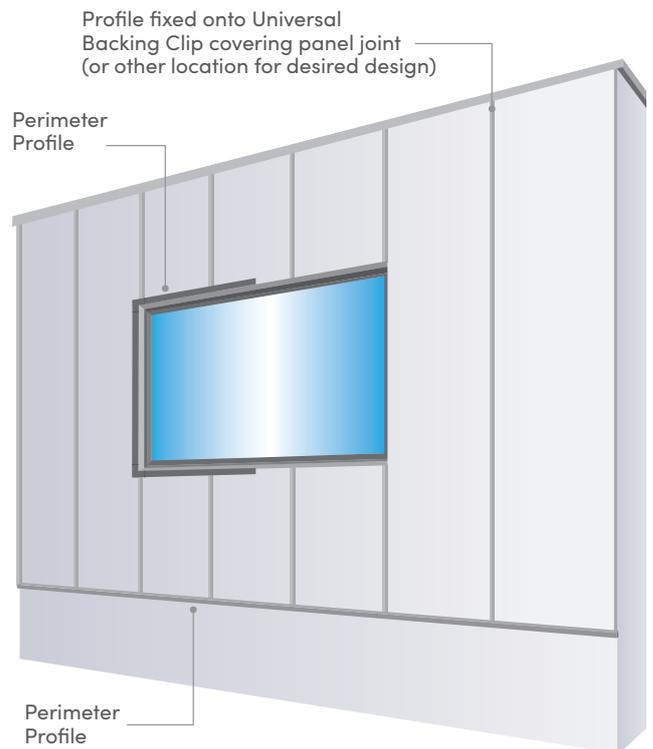

Profile and accessory colours:

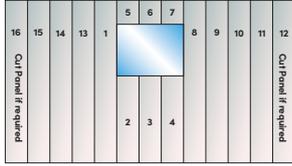

Hebel PowerProfile System

Hebel PowerProfile Accessories Placement

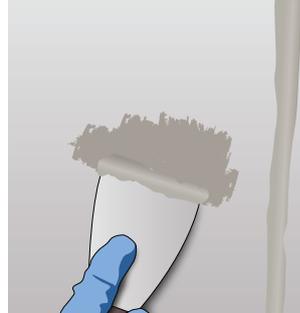

Installation Overview - see PowerProfile Installation Guide for full details.

STEP 1

Hebel panels are to be installed with the utmost consideration of aesthetic locations of the profiles, and especially in relation to the position of control joints.

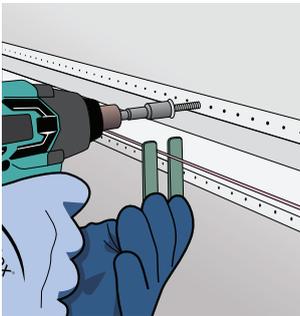

Carefully consider the desired design outcome when installing panels.

STEP 6

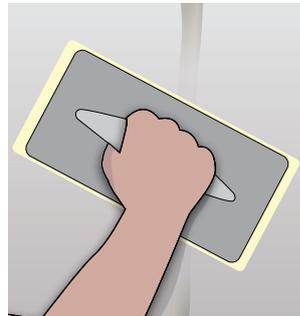

Patch minor panel imperfections and screw holes using Dulux Acratex Power Patch.

Selleys Spakfilla Rapid should be used to achieve a flush finish when using the Sienna Naturale coating system.

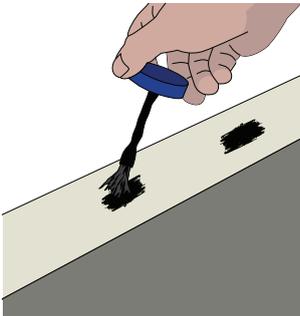

STEP 2

Fix Hebel perforated top hats to timber or steel frame ensuring they are plumb, level. Creating a straight and true substrate.

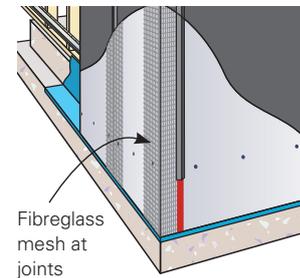

STEP 7

Use sand float to remove excess Hebel Adhesive and smooth the joints between each of the panels.

STEP 3

Coat any exposed steel reinforcing from cutting with Hebel anti-corrosion paint.

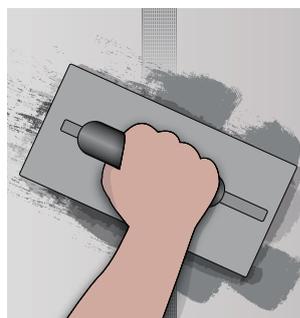

STEP 8

Install 200mm of 165gsm wide mesh to each Hebel panel joint.

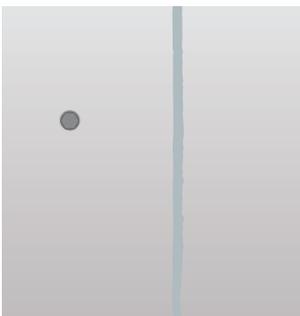

STEP 4

Install PowerPanel^{XL} panels vertically by applying Hebel Adhesive to each panel joint and screwing off to perforated Top Hats.

STEP 9

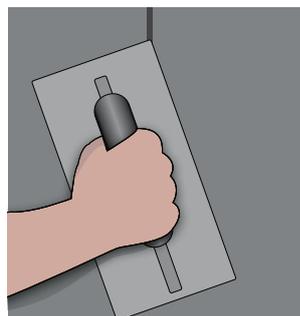

Install Base Levelling Skim Coat. Coatings are designed for the mesh to be slightly visible.

STEP 5

Install control joints in accordance with Hebel Install Guides. The location of joints must be considered with respect to location of profile.

Maintain 10mm to joints.

STEP 10

Coatings are to go over the control joint. Using a blade (hand scribe or trowel) cut nice straight over the sealant joint through to the base coat to a width no greater than 5mm and to a depth to meet the sealant.

The coating will go over the joint and no cut is required.

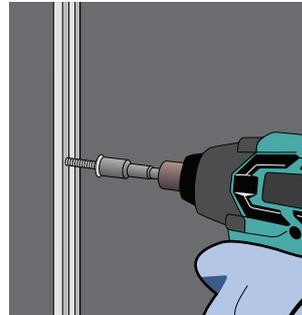

Installation Overview - see PowerProfile Installation Guide for full details.

STEP 11

Apply the recommended coating system. Allow to fully dry prior to adhering any backing clips.

Note: Dulux Sienna Naturale will give a very smooth finish and the closest resemblance to a metal cladding finish however, it is a coating upgrade.

Step 15

Screw the Universal Backing Clip to the wall at least 100mm from the end of the clip, and then at 300mm centres.

At control joints it is recommended that screws through the base clip are a minimum of 20mm from the end of the panel.

Note: Pre-drilling a 2.5mm hole may be required.

STEP 12

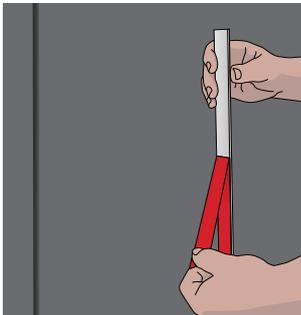

Before applying backing clip, clean the surface with a lint free cloth and Isopropyl Alcohol.

Step 16

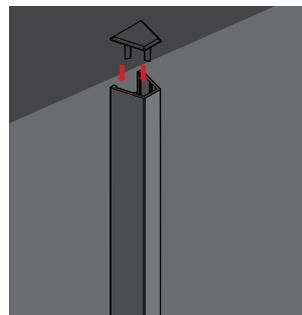

Snap profile to backing clip using a rubber mallet.

A load spreader can also be used to further protect the Aluminium.

Step 13

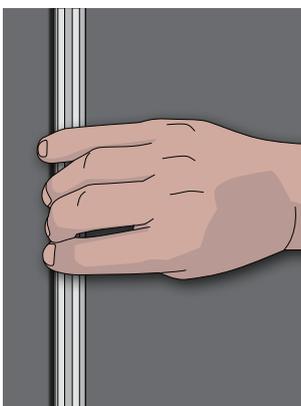

Peel approximately 150mm length of paper from backing clip tape, preferably at the base.

Step 17

Finish with inserting end caps to each profile at visible ends.

Perimeter profiles can be used around windows and openings.

Step 14

It is critical to install the backing clip straight so ensure you use a levelling tool. Fix backing clip to the wall keeping it straight to the levelling tool whilst peeling the tape in an upwards motion.

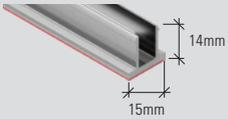

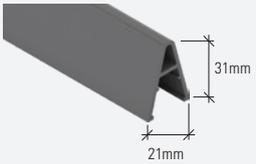

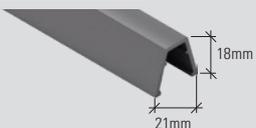

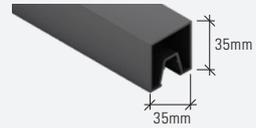

The tape will adhere IMMEDIATELY.

The backing clips can be applied in sections or continuously across the facade.
